A new series of new records of orchid species is given for several regions of Russia within the frameworks of the Project for Mapping of Russian Orchids. The current article presents the data on the discovery of *Epipactis atrorubens* in the Tula Region; *E. helleborine* in the Khabarovsk Region; *E. palustris* in the Republic of Buryatiya, *E. persica* in the Stavropol' Territory, the Republics of Kabardino-Balkariya and North Ossetia – Alania; *Epipogium aphyllum* in the Republic of Khakassiya, *Hammarbya paludosa* in Kemerovo Region, *Neotinea ustulata* (= *Orchis ustulata*) in the Kaluga and Tambov Regions. Also we report the second confirmed locality of *Ponerorchis cucullata* (= *Neottianthe cucullata*) in the Tver Region. Finally, we report some new but dubious localities of some species, probably based on incorrectly labelled herbarium material; alternatively, however, they may serve as evidence of the distribution of certain species in the past (collections of *Neotinea ustulata* from the Republic of Karelia, *Anacamptis laxiflora* (= *Orchis palustris*) from Sverdlovsk Region etc.).

Keywords: orchids, Orchidaceae, mapping of Russian Orchids, protected species of vascular plants, Red Data Book.

ACKNOWLEDGEMENTS

The study conducted in 2020 was supported by Russian Foundation for Basic Research, project no. 20-04-00561. The technical work with the database before 2020 was carried out within the framework of the institutional research project (no. AAAA-A19-119031290052-1) of the Komarov Botanical Institute of the Russian Academy of Sciences. We also thank our colleagues who kindly provided their data for the present-day stage of our mapping project: V.A. Agafonov, I.G. Bikbaev, T.G. Ivchenko, E.S. Kaz'mina, V.V. Merker, A.A. Muldashev, N.A. Zenkova.
