As a result of examining the moss collection gathered by E.F. Vilka in summer of 2020 in Magadan Region, 9 species new to the flora of region were revealed, and new localities of 15 rare species were discovered. The findings of such rare species as *Schistidium frahmianum* and *Hygrohypnella bestii* are of special interest. Locations for all species are given, and the distribution of some species is briefly outlined. The moss flora of the Magadan Region comprises 412 species according to the literature and our newly obtained data.

Keywords: mosses, new and rare species, Magadan region, Russia

ACKNOWLEDGEMENTS

We are very grateful to the directorate of the Magadan Nature Reserve, especially to I.G. Utekhina, the Deputy Director for Science, and to rangers V. S. Ammosov, A. I. Parshin and Y.I. Parshin, G.M. Buta (Seimchan cluster) and S.V. Mondo (Yama cluster) for their comprehensive assistance with organization of the field works. Besides, we would like to thank the group of tourists led by V.V. Zarudny and the Kayur Travel Company and A.N. Fedorov, its director, for the opportunity to collect mosses on the Yama River.

The study of E.F. Vilka was carried out with financial support of an internal competition of the IBPN FEB RAS for young researchers and with a partial support of grant 19-05-00477A “Development of the Late Pliocene and Pleistocene climatochronostigraphic scale of the subarctic regions of the Far East”; the work of O.M. Afonina was partially supported by the Russian Foundation for Basic Research (grant 18-05-60093).
