Fifteen non-tuberous species belonging to 3 sections of the genus *Corydalis* DC. from Tajikistan are examined. The largest section *Strictae* (Fedde) Wendelbo includes 12 species, 7 of them being endemic; the section *Chrysocapnos* Wendelbo includes 2 species, the section *Oreocapnos* Popov ex C.Y. Wu et Chuang – 1 species. The paper contains an annotated synopsis and the key for identification of these species. For every species, the following information is provided: accepted name, synonyms, type citation, characteristics of habitats, distribution in Tajikistan, general distribution, and list of examined specimens.

Keywords: *Corydalis*, Tajikistan, distribution

DOI: 10.31857/S0006813621090106

ACKNOWLEDGEMENTS

The author expresses her sincere gratitude to A.V. Sochivko for preparing the illustrations.

The work was performed in the framework of the institutional research project “Vascular plants of Eurasia: taxonomy, flora, plant resources” (AAAA-A19-119031290052-1) of the Komarov Botanical Institute of the Russian Academy of Sciences.
