78 species new to the lichen flora of the Kerzhenskiy Reserve are recorded based on the authors' field research in 2020–2021. 65 species are new to the Nizhny Novgorod Region. Among them, *Lecanora densa* is reported for the first time for Russia; 4 species, namely *Gyalecta nigricans*, *Micarea microareolata*, *Protoparmelia oleagina*, and *Stigmidium cerinae*, are new to the Central European Russia. The information about the localities, ecology and distribution of mentioned species is provided.

Keywords: *Lecanora densa*, lichens, new findings, distribution

ACKNOWLEDGEMENTS

This work was carried out within the framework of the state assignments of the Kerzhenskiy State Nature Reserve (no. 1-22-45-2). The work of I.N. Urbanavichene was carried out within the framework of the State Research Program of the Komarov Botanical Institute of RAS no. 121021600184-6 “Flora and taxonomy of algae, lichens and bryophytes in Russia and phytogeographically important regions of the world”.
