FLORISTIC RECORDS

VAUCHERIA LITOREA (XANTHOPHYCEAE), A NEW ALGAL SPECIES FOR THE WHITE SEA

Vaucheria litorea, an algal species previously unknown in the White Sea, was discovered from the coastal locality near the Cape Chesmensky, the Onega Bay, in September 2021. The new record is the northernmost one of the species. Detailed morphological description based on microscopic observations of the specimen is given.

Keywords: White Sea, *Vaucheria*, macrophytes, littoral, new record

ACKNOWLEDGEMENTS

The collection of specimens was supported by the grant of the Russian Geographic Society № 02/2021-P "The White Sea – the Gateway to the Arctic. Mysteries of feathered migrants". The microscopic studies were carried out within the state assignment to IBIW RAS, theme no. 121051100099-5 "Diversity, structure and functioning of algae and plant communities in continental waters".

The authors are grateful for the support in conducting the research to the administration and staff of the Kenozersky National Park, especially P.A. Futoran and A.V. Bragin.
